

## **TOUCH SCREEN WITH SELECTIVE TOUCH SOURCES**

### **Abstract**

5 A touch system for determining the position of a touch on a touch sensor  
includes a touch sensor and a user contact point separate from the touch sensor.  
Information from both the user contact point and a touch to the touch sensor is used to  
determine the position of the touch on a touch sensor. Multiple contact points or touch  
sensors may be incorporated into the touch system. The touch system may be configured  
to selectively activate the touch sensors and contact points and distinguish between  
10 information generated from the touch sensor and contact point.
